Il corpo nero

Un corpo caldo...

- Tutti i corpi caldi emettono “luce”
 - non è vero il viceversa
- Perché?

Un corpo nero...

- In equilibrio con la radiazione da lui stesso emessa
- Se l'energia è trasportata da un'onda
 - I suoi costituenti oscillano con frequenza ν
 - Ampiezza qualunque
- Se l'energia è trasportata da quanti di energia $h\nu$
 - I suoi costituenti oscillano con frequenza ν che dipende dall'energia del quanto
 - Posso emettere 0 oppure 1 quanto, non 0.2 quanti

L'effetto fotoelettrico

Natura della luce: onde

Onde ed energia

Effetto fotoelettrico con i quanti

Applicazioni

La misura e il Principio di Heisenberg

■ “Esiste” solo ciò che si misura

■ Misura della posizione di un elettrone in un atomo

$$\Delta x \Delta p \geq \hbar$$

■ Misura dell'energia di un elettrone in un atomo

$$\frac{\Delta x}{\Delta t} \Delta p = v \Delta p = 2\Delta E \geq \frac{\hbar}{\Delta t}$$

$$\Delta E \Delta t \geq \frac{\hbar}{2}$$

Onde di materia

$$\nu = \frac{c}{\lambda} = \frac{p}{h}$$

- Diffrazione di neutroni
- Microscopi elettronici

Atomi classici

Atomi quantistici

Modelli a confronto

Modelli a confronto

Modelli a confronto

$$\Psi(\vec{x}) = \alpha\Psi_1(\vec{x}) + \beta\Psi_2(\vec{x})$$

Onde elettroniche

Onda stazionaria

$$\psi(x, t) = \sum_n A_n \sin \left(\frac{2\pi n x}{\lambda} + \phi_n \right)$$

Onde stazionarie

$$2\pi r = n\lambda = n \frac{h}{p}$$

$$pr = mvr = L = n \frac{h}{2\pi} = n\hbar$$

■ Momento angolare e quantità di moto quantizzati \Rightarrow energie quantizzate

$$E = -k^2 \frac{e^4 m}{2\hbar^2 n^2}$$

Spettri atomici

Lo spin: Stern-Gerlach

http://upload.wikimedia.org/wikipedia/commons/9/9e/Quantum_spin_and_the_Stern-Gerlach_experiment.ogg

Lo spin: Stern-Gerlach

La somma dei momenti angolari

$$J = L + S$$

$$L = 1; S = \frac{1}{2}$$

$$J = L + S = \frac{3}{2}$$

$$J = L - S = \frac{1}{2}$$

Lo stato degli elettroni

■ Il principio di esclusione classico

- due punti materiali non possono stare nello stesso stato nel medesimo istante

■ Il Principio di esclusione di Pauli

- due elettroni non possono stare nello stesso stato nel medesimo istante

■ Stato = $|E, L, L_z\rangle$

- $\left|E, \frac{3}{2}, +\frac{1}{2}\right\rangle \neq \left|E, \frac{3}{2}, -\frac{3}{2}\right\rangle$

La chimica

Periodic Table of the Elements

$$L \leq n - 1$$
